Global Energy Flows, Thermal Energy Storage, & Ocean Heat Content Estimates

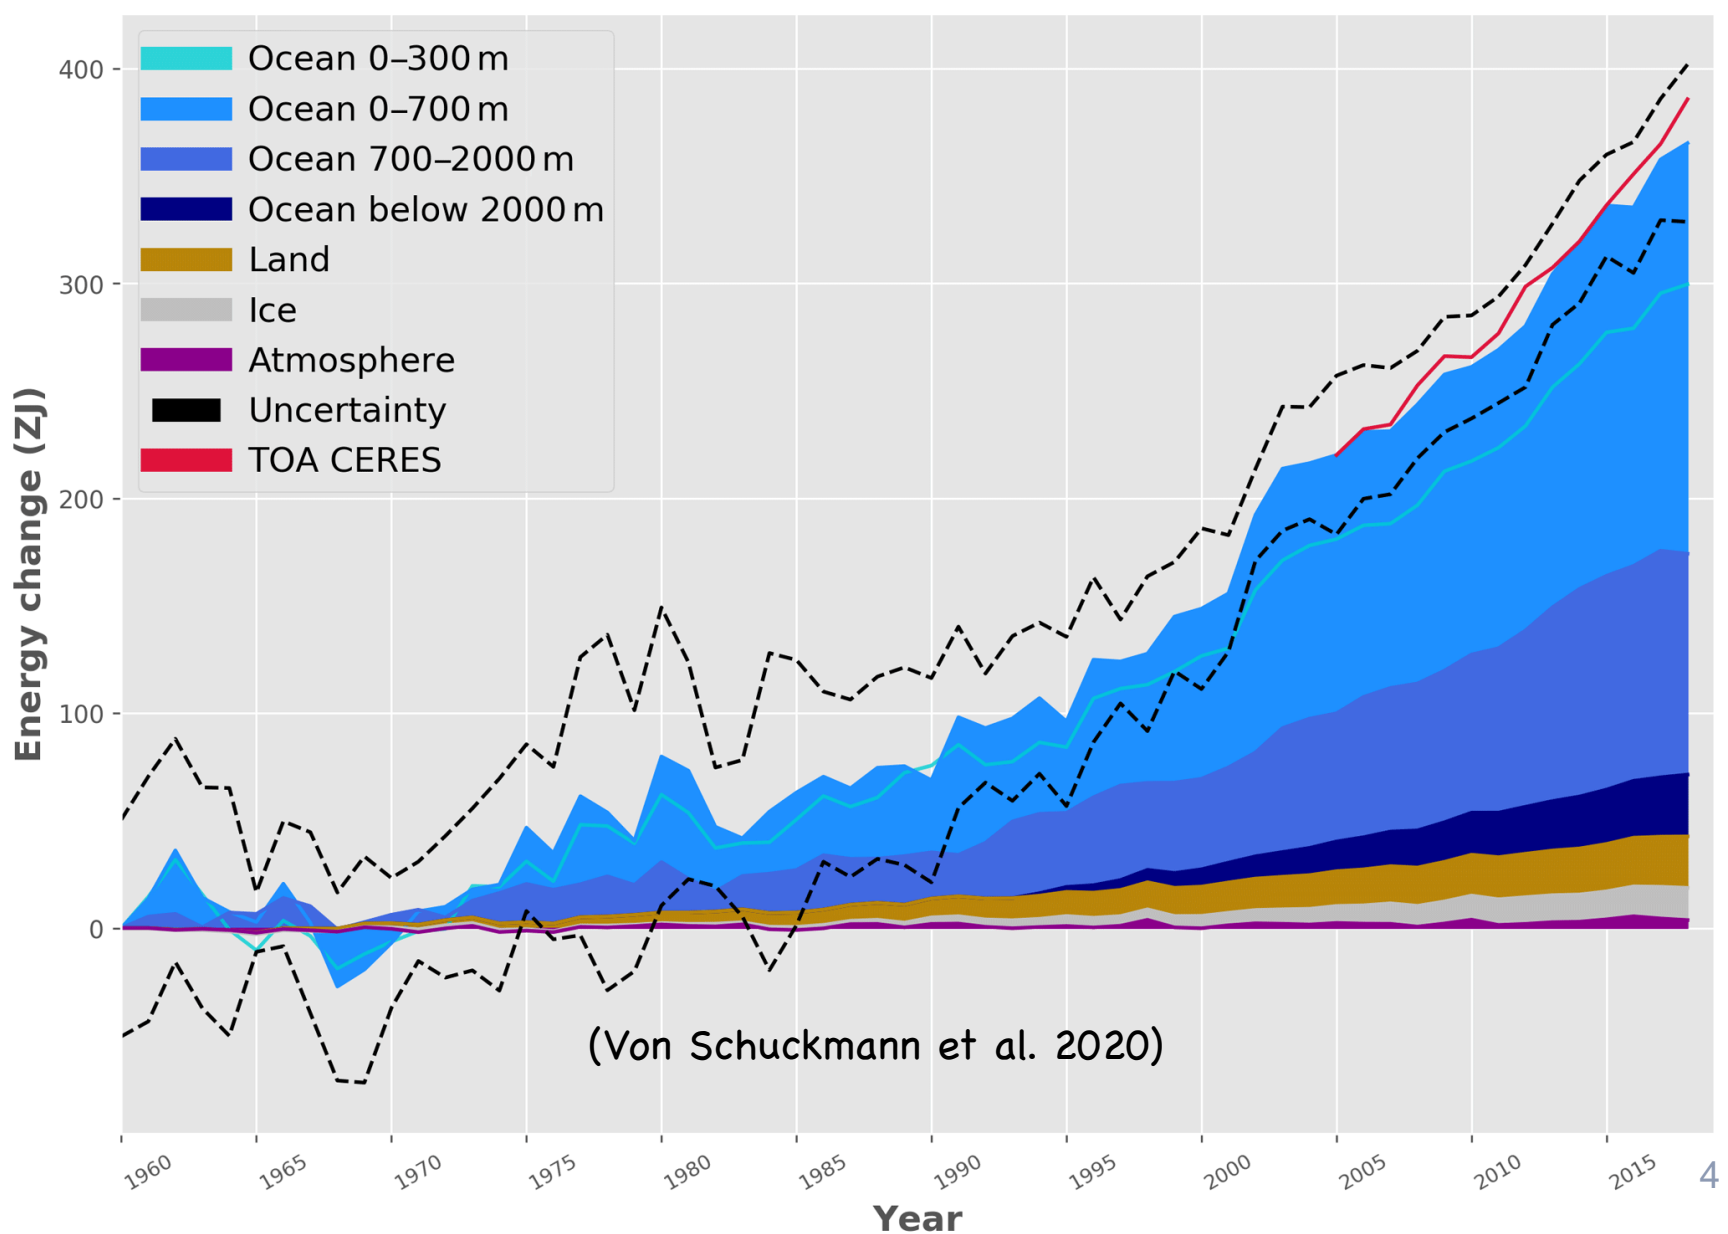

Global Energy Flows

(IPCC, 2013)

- Imbalance of $\sim 0.6 \text{ W m}^{-2}$ (not into corn fields though – *into the ocean!*)
- Small difference of big numbers – measuring storage change robust?

Thermal Energy Storage

Ocean Heat Content Estimate Spread

Ocean Heat Content Dirty Laundry: Changing Instrumentation, XBT Biases, & Sparse Historical Sampling

MBT, 1938: $\pm 0.1^{\circ}\text{C}$, $\pm 1\%$ z, < 300 m. XBT, 1966: $\pm 0.1^{\circ}\text{C}$, $\pm 2\%$ z, 400 & 750 m.

Reversing Therm., 1900: $\pm 0.01^{\circ}\text{C}$, $\pm 1\%$ z, btm. Argo, 2000: $\pm 0.01^{\circ}\text{C}$, 0.1% z, 2000 m.
CTD, 1961: Accuracy by mid-1980s $\pm 0.002^{\circ}\text{C}$, $\pm 0.05\%$ z, 6000 m.

Changing Ocean Instrumentation

(Meyssignac et al. 2019)

- Bottle, CTD, & profiling float data good & widely distributed
- Glider, moored buoy, & marine mammal data often localized
- XBT & MBT data shallow, low accuracy, & have *bias* issues.

Ocean Heat Content & Instrument Biases

- XBT bias corrections greatly reduced mid-1980s spurious ocean warming
- Large (sampling) uncertainties before circa 1970.

Changing Ocean Sampling

(Meyssignac et al. 2019)

- Percentage of annual ocean coverage in 3° x 3° bins
- 0-2000 m really only covered since 2005 (Argo)

The Argo Revolution for Ocean Temperature and Salinity Data

Global Fraction of Ocean Sampled

Argo

Argo

- Year-Round, High-Quality temperature & salinity data
- Publicly available in near real-time
- Started in 2000
- Achieved near global coverage circa 2005
- Upper 2 km of ocean sampled

CERES-In Situ Comparison of Earth's Energy Uptake

Thermal Energy Storage

- In situ observational anchor (trends):
 - Ocean 0–2 km:
 $0.62 \pm 0.05 \text{ W m}^{-2}$ (2005–2019)
 - Ocean 2–6 km:
 $0.062 \pm 0.038 \text{ W m}^{-2}$ (1992–2011)
 - Land:
 $0.037 \pm 0.004 \text{ W m}^{-2}$ (2005–2018)
 - Ice:
 $0.031 \pm 0.006 \text{ W m}^{-2}$ (2005–2016)
 - Atmosphere:
 $0.014 \pm 0.009 \text{ W m}^{-2}$ (2005–2018)
- Net trend: $0.77 \pm 0.06 \text{ W m}^{-2}$ (2005 to 2019)

In situ "Anchor"

After Loeb et al. (submitted)

- Trend: 0.77 W m^{-2} with acceleration evident

CERES

Satellite Top-of-Atmosphere (TOA) energy fluxes
Precise, but requires in situ anchor for accuracy

Earth's Energy Uptake Variations

After Loeb et al. (submitted)

- In Situ $0.43 \pm 0.40 \text{ W m}^{-2} \text{ decade}^{-1}$; CERES $0.50 \pm 0.47 \text{ W m}^{-2} \text{ decade}^{-1}$
- Correlation coefficient 0.70

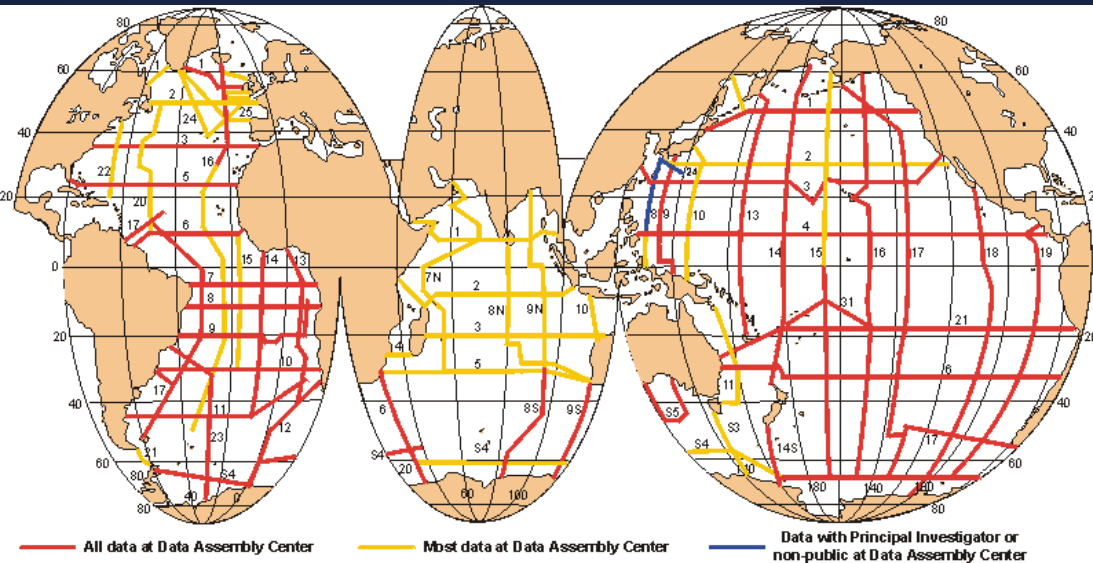

Conclusions

- Earth's Energy Imbalance is a (relatively) small difference of big numbers
- Best quantified by changes in reservoirs of heat (9/10ths ocean warming)
- Sparse sampling and instrument biases are issues for global ocean heat content estimates in the pre-Argo record
- About 15 years of Argo data greatly reduces ocean heat storage uncertainties on annual time scales
- Two complementary but independent measurement systems (CERES and Argo) show correlated interannual variations in Earth's energy storage!
- They both find a statistically significant, and similar acceleration in the warming rate, with approximate doubling from 2005–2019.

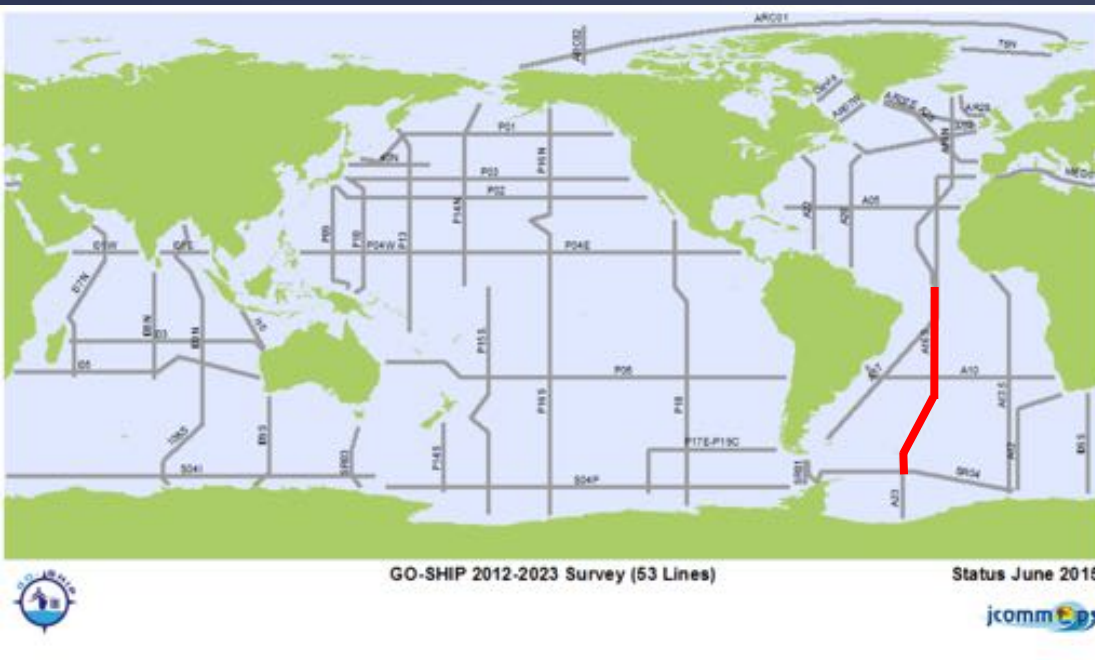

Deep Argo

Deep Ocean Sampling: WOCE & GO-SHIP

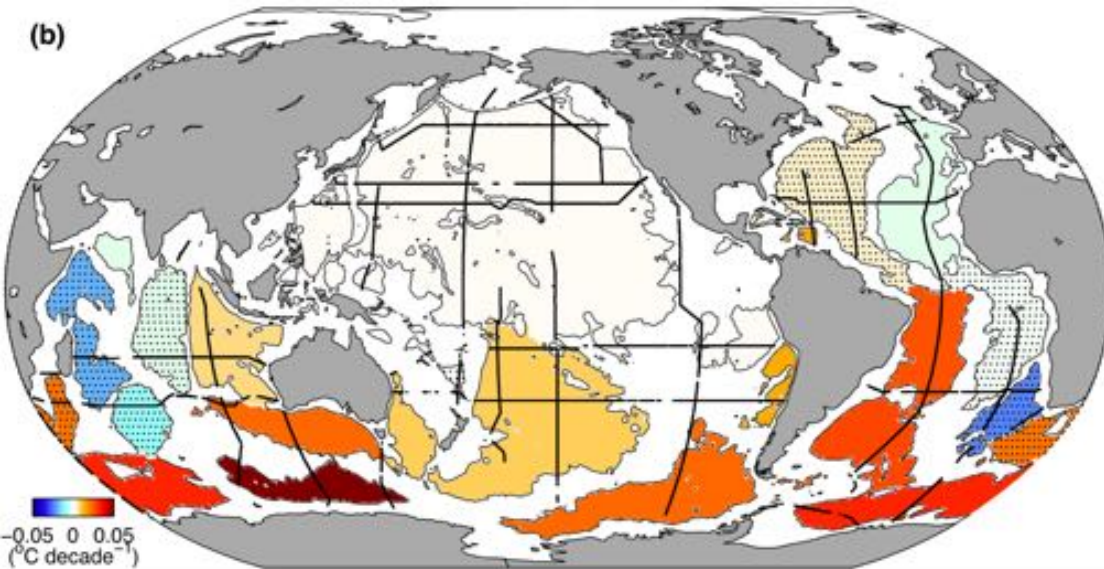

- WOCE: 1990s accurate ocean climate baseline
- Monumental int'l effort
- Full depth, transocean
- Temp. $\pm 0.002^\circ \text{C}$
- Salinity $\pm 0.003 \text{ PSS-78}$
- Many other parameters

- Decadal resurveys:
- CLIVAR/ CO_2 (1999–2012)
- GO-SHIP (2012–2023)
- Key sections cross major deep basins
- T $\pm 0.001^\circ \text{C}$
- S ± 0.003
- Ongoing effort

Observed Deep Ocean Warming

- Sparse decadal ship surveys
- Revealing deep ocean warming
- Qualitative assessment

After Purkey & Johnson
(2010)

Example:
S. Atlantic
1989–2014
(Johnson et al. 2015)

Informing Deep Argo array design using Argo and full-depth hydrographic section data

(Johnson, Lyman, & Purkey; 2015)

[doi:10.1175/JTECH-D-15-0139.1](https://doi.org/10.1175/JTECH-D-15-0139.1)

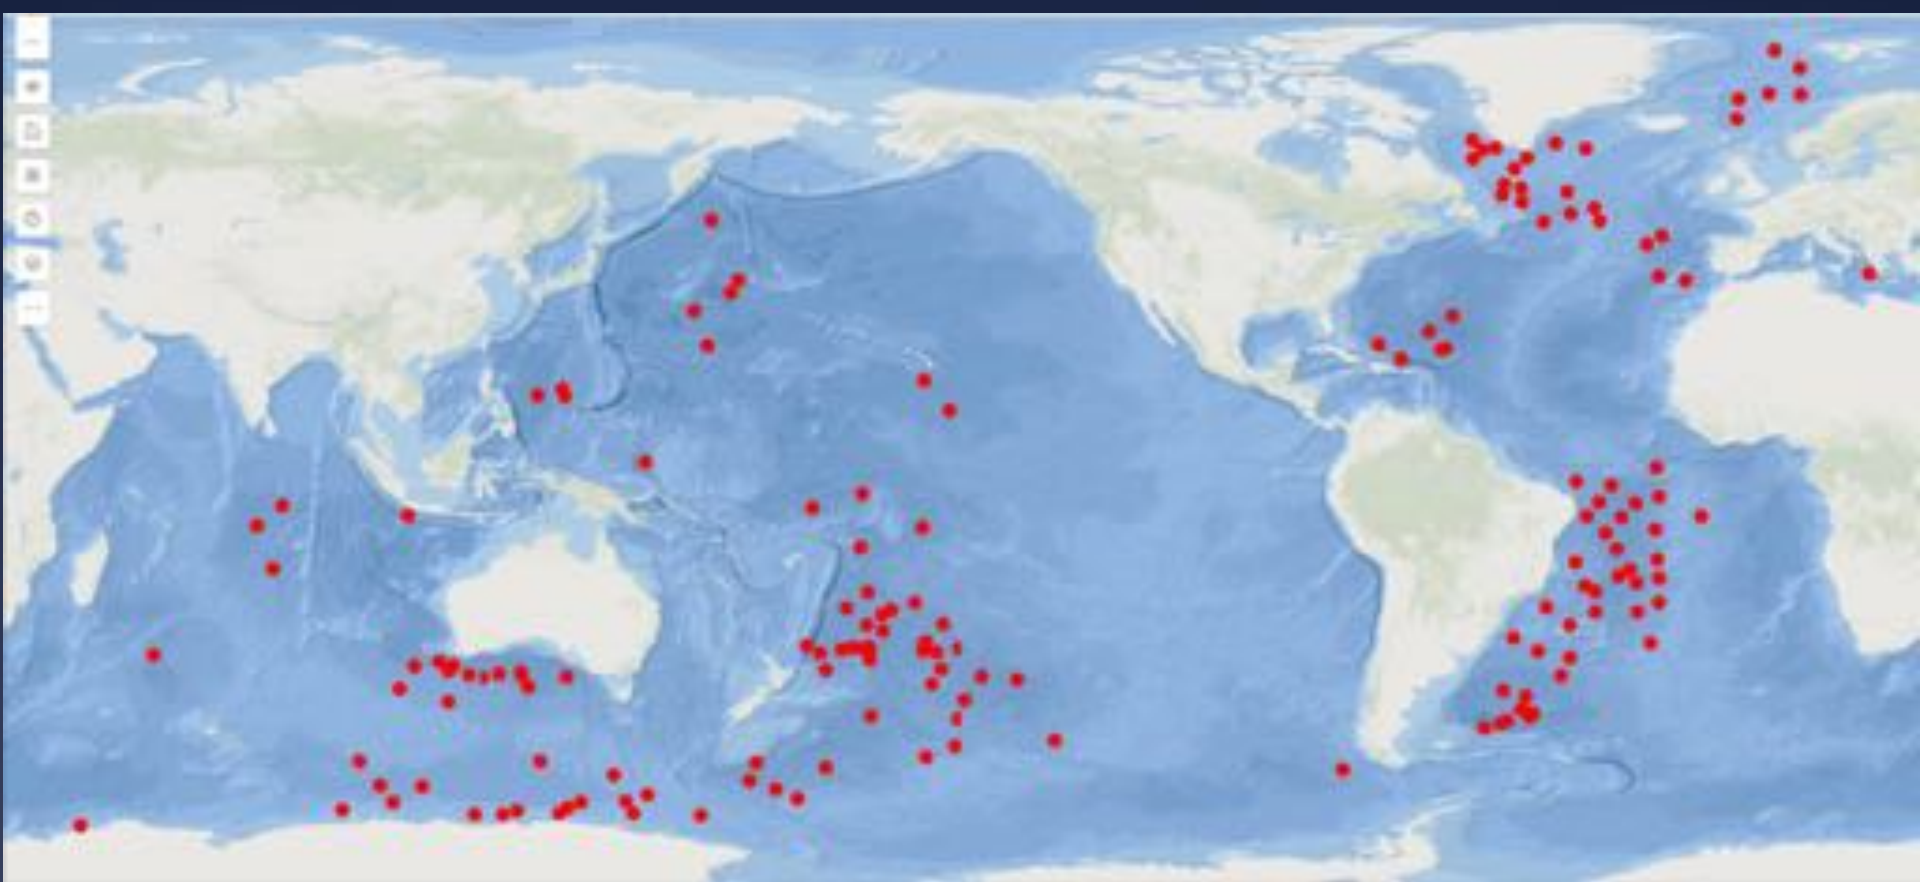

- 1228 floats
- 10-day cycles
- 0-6000 m high-quality profiles
- Reduce uncertainties of decadal heat gain over **5-fold**
- Allow continual assessments of deep ocean changes

Ocean Sampling: Deep Argo Impact

Deep Argo Status: March 2021

- 162 Deep floats operational in regional pilot arrays
- Still working to raise funding for a global array
